accurate radiation dosimetry is a requirement of radiation oncology diagnostic radiology and nuclear medicine it is necessary so as to satisfy the needs of patient safety therapeutic and diagnostic optimisation and retrospective epidemiological studies of the biological effects resulting from low absorbed doses of ionising radiation the radiation absorbed dose received by the patient is the ultimate consequence of the transfer of kinetic energy through collisions between energetic charged particles and atoms of the tissue being traversed thus the ability of the medical physicist to both measure and calculate accurately patient dosimetry demands a deep understanding of

the physics of charged particle interactions with matter interestingly the physics of charged particle energy loss has an almost exclusively theoretical basis thus necessitating an advanced theoretical understanding of the subject in order to apply it appropriately to the clinical regime each year about one third of the world's population is exposed to ionising radiation as a consequence of diagnostic or therapeutic medical practice the optimisation of the resulting radiation absorbed dose received by the patient and the clinical outcome sought whether diagnostic or therapeutic demands accuracy in the evaluation of the radiation absorbed doses resulting from such exposures this requirement arises primarily from two broadly encompassing factors the requirement in radiation oncology for a 5 or less uncertainty in the calculation and measurement of absorbed dose so as to optimise the therapeutic ratio of the probabilities of tumour control and normal tissue complications and the establishment and further refinement of dose reference levels used in diagnostic radiology and nuclear medicine to minimise the amount of absorbed dose for a required degree of diagnostic benefit the radiation absorbed dose is the outcome of energetic charged particles decelerating and transferring their kinetic energy to tissue the calculation of this energy deposition characterised by the stopping power is unique in that it is derived entirely from theoretical principles this dominant role of the associated theory makes its understanding of fundamental to the calculation of the radiation absorbed dose to the patient the theoretical development of charged particle energy loss recognised in medical physics textbooks is in general limited to basic derivations based upon classical theory generally a simplified form of the bohr theory more advanced descriptions of for example the bethe bloch quantum result usually do not go beyond the simple presentation of the result without full explanation of the theoretical development of the theory and consideration of its limitations its dependencies upon the born perturbation theory and the various correction factors needed to correct for the failures of that born theory at higher orders this is not appropriate for a full understanding of the theory that its importance deserves the medical radiation physicist should be aware of the details of the theoretical derivations of charged particle energy loss in order to appreciate the levels of accuracy in tabular data provided in reports and the calculation methodologies used in modern monte carlo calculations of radiation dosimetry

this textbook extends from the basics of femtosecond physics all the way to some of the latest developments in the field in this updated edition the chapter on laser driven atoms is augmented by the discussion of two electron atoms interacting with strong and short laser pulses as well as by a review of atomic rings and low energy structures in photo electron spectra in the chapter on laser driven molecules a discussion of 2d infrared spectroscopy is incorporated theoretical investigations of atoms and molecules interacting with pulsed lasers up to atomic field strengths on the order of 10^{16} w cm² are leading to an understanding of many challenging experimental discoveries the presentation starts with a brief introduction to pulsed laser physics the basis for the non perturbative treatment of laser matter interaction in the book is the time dependent schrödinger equation its analytical as well as numerical solution are laid out in some detail the light field is treated classically and different possible gauges for the field matter interaction are discussed physical phenomena ranging from paradigmatic rabi oscillations in two level systems to the ionization of atoms the generation of high order

harmonics the ionization and dissociation of molecules as well as the control of chemical reactions are presented and discussed on a fundamental level in this way the theoretical background for state of the art experiments with strong and short laser pulses is given the new text is augmented by several additional exercises and now contains a total of forty eight problems whose worked out solutions are given in the last chapter in addition some detailed calculations are performed in the appendices furthermore each chapter ends with references to more specialized literature

the book explains the fundamental ideas of density functional theory and how this theory can be used as a powerful method for explaining and even predicting the properties of materials with stunning accuracy

deals with elastic inelastic and reactive collisions between heavy particles the impact energy range extends from sub thermal to energies at which nuclear forces become significant although the focus is on experiment theory is integrated with experimental discussions scattering resonances beam monochromators particle detectors coincidence measurements and laser photodetachment are among the topics covered includes extensive references and problem sets

advances in atomic and molecular physics

the aim of the book is to give a coherent and comprehensive account of quantum scattering theory with applications to atomic molecular and nuclear systems the motivation for this is to supply the necessary theoretical tools to calculate scattering observables of these many body systems concepts which are seemingly different for the atomic molecular scattering from those for nuclear systems are shown to be the same once the physical units such as energy length are diligently clarified many body resonances excited in nuclear systems are the same as those in atomic systems and come under the name of feshbach resonances we clarify this we also lean heavily on semi classical methods to explain the physics of quantum scattering and especially the interference seen in the angle dependence of the cross section having in mind a wider readership the book includes sections on scattering in two dimensions which is of use in surface physics several problems are also included at the end of each of the chapters

quanta provides a non mathematical and highly visual account of the concepts of quantum mechanics entries ordered alphabetically range in length from one paragraph to several pages and each describes the physical significance of a topic with simplicity and precision

written as a collection of problems hints and solutions this book should provide help in learning about both fundamental and applied aspects of this vast field of knowledge

where rapid and exciting developments are taking place

papers presented at the 8th national workshop on atomic and molecular physics organized by the school of physics university of hyderabad december 6 12 1990

this text provides a summary of the key ideas techniques and research results in the field of atomic molecular and optical physics it is intended to be of interest to all physicians especially in condensed matter and chemical physics and engineers as

a first order optical potential is used to calculate the total and absorption cross sections for nucleus nucleus scattering the differential cross section is calculated by using a partial wave expansion of the lippmann schwinger equation in momentum space the results are compared with solutions in the eikonal approximation for the equivalent potential and with experimental data in the energy range from 25a to 1000a mev
