this book is primarily intended for a first year undergraduate course in programming it is structured in a problem solution format that requires the student to think through the programming process thus developing an understanding of the underlying theory each chapter is more or less independent although the author assumes some moderate familiarity with programming constructs the book is easily readable by a student taking a basic introductory course in computer science students and teachers will find this both an excellent text for learning programming and a source of problems for a variety of courses

a bestseller in its french edition this book is original in its construction and its success in the french market demonstrates its appeal it is based on three principles 1 an organization of the chapters by families of algorithms exhaustive search divide and conquer etc on the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings some of these will be found in different chapters 2 for each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 for the most part the book details 150 problems spanning seven families of algorithms for each problem a precise and progressive statement is given more importantly a complete solution is detailed with respect to the design principles that have been presented often some classical errors are pointed out roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions
